                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a DNA comprising the doxA gene encoding daunorubicin 14-hydroxylase and at least 1 gene (II) that confers daunorubicin (DA) and doxorubicin (DO) resistance. Cells expressing the DNA are used to convert DA to DO. DO is a well known anticancer agent. (II) imparts a high degree of resistance to DO in the host cells and so provides a more efficient conversion process. The present sequence represents a DNA consisting of the doxA, dnrv and the C-terminal part of the dnrU (deldnrU) genes. This sequence is the complementary strand to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 2870 BP; 386 A; 1010 C; 1093 G;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This DNA sequence comprises the doxA gene of Streptomyces sp. CC strain C5 that codes for daunomycin C-14 hydroxylase (DC14H) (see AAW3612B), a P450-like enzyme useful for the production of C doxorubicin from daunomycin, and for the hydroxylation and C oxidation of other anthracyclines. The gene was identified by CC sequencing an approximately 8 kb fragment of the daunomycin content of the daunomycin concorporated into various vectors, including PANT195 (see PAND1451). The gene has been incorporated into various vectors, including PANT195 (see PAND1451) and PANT199 (see PAND1452). Claimed methods for production of CC doxorubicin include: the use of a host microorganism transformed with a plasmid which contains the doxA gene; incubating a culture CC of Streptomyces sp. strain C5 with daunomycin; and incubating DC14H with daunomycin. The enzyme can also be used in claimed methods of producing 13-dihydrocarminomycin and carminomycin and daunomycin from 13-deoxycarminomycin, and of producing 13-dihydrodaunomycin and carminomycin and daunomycin from 13-deoxydaunomycin. The methods preclude the CC use of halogens as required in the current chemical methods.

                                                                                                                                        The present sequence is the drxA gene coding sequence for daunorubicin 14-hydroxylase, isolated from Streptomyces peucetius strain 29050. The enzyme converts daunorubicin to doxorubicin, an anthracycline used widely as an antitumour agent. A vector contg. the drxA gene could be used to transform a suitable host cell which produces daunorubicin, in order to enhance bioconversion of daunorubicin broduces daunorubicin can be carried out either by using directly the free or immobilised transformed cells or by isolating the enzyme, which can be used in the free form or immobilised to resins, glass, cellulose or similar substances by ionic or covalent bonds, or grafted to fibres permeable to the substrate or insolubilised by cross-linkage.

The doxA gene codes for daunomycin C-14 hydroxylase (see AAW36128), an enzyme capable of converting daunomycin to the anticancer agent doxorubicin. Host cells, especially Streptomyces host cells, transformed with pANY195 can be used in methods for the production of doxorubicin from daunomycin or the hydroxylation and oxidation of other anthracyclines.

This sequence represents an SstI-AatII restriction fragment from the Streptomyces peucetius genome, which contains the dnrU gene. The invention relates to a recombinant microorganism which produces doxorubicin (DAR), in which at least 1 daunorubicin (DAR) metabolism gene selected from dnrU and dnrX, has been inactivated. The microorganism is preferably S. peucetius WMH1658, WMH1654 and WMH1662. The function of the DAR gene is inactivated by insertion of a gene (preferably neomycin/kanamycin resistance gene aphII) into the daunorubicin metabolism gene. The blocking of the function of at least one gene of DAR metabolism can increase DAR and DOR production levels and cause
                                                                                                                                           Production of doxorubicin and daunorubicin daunorubicin producing microorganism in w dnrX metabolism gene has been inactivated
                                                                                                                            Disclosure; Fig

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query
